\*Indicates that the change from the preceding year in the table is statistically significant; child poverty reflects children related to their head of household; uninsured rate reflects only those ages 0 to 64.

## Measuring Poverty

Official poverty data are based on the federal poverty thresholds, which are used to determine poverty status. The measure is not geographically specific and does not reflect what it takes for families to make ends meet.

### 2011 Federal Poverty Thresholds

Family Size	Poverty Threshold
1	\$11,484
2	\$14,657
3	\$17,916
4	\$23,021

What does it really take to make ends meet?

Far more people struggle to make ends meet than the official poverty data suggest. Most experts agree that it takes around twice as much income as the federal poverty threshold for families to get by and meet their most basic needs.

All data are derived from the U.S. Census Bureau's *American Community Survey* 1-year estimates program. The American Community Survey released estimates on 2011 income, poverty, and health insurance coverage, which are the most current data available for geographies with populations over 65,000. For more information on the American Community Survey, visit [www.census.gov/acs/www/](http://www.census.gov/acs/www/). Statistical significance refers to the probability that the observed changes are "true" rather than the result of an error in sampling or estimation. Data included here are statistically significant at the 90th percentile.
